Run this campaign — 20,000 EGP per month

The complete campaign at your budget. Everything here is executable; nothing is left as a decision for later.

One platform: Meta. Plus Google Business posts, which are free. The other four folders stay packed — `00-BUDGET-20K-EGP` explains why their own daily minimums put them out of reach.

Budget	20,000 EGP/month ≈ $417 ≈ AED 1,530
Daily	655 EGP ≈ $13.65
Market	**Dubai only**
Niche	**Clinics only**
Campaigns to build	3 ad sets inside 1 campaign
Ads live on day 1	1

Before day 1 — the week that cannot be skipped

Three of these are hard stops. An ad cannot run without them.

	TASK	WHY	TIME
☐	**Meta Business Manager + domain verification**	Longest lead item of the whole launch. Start it first, today.	10 min + 1–3 days waiting
☐	**Meta Pixel on every page, Conversions API server-side**	Without it the campaign optimises on clicks, the metric least connected to money	Half a day
☐	**Build `/leak-test`**	One field: website URL + email. Wired to the CRM. The ads all point here	1 day
☐	**Assign the fulfilment owner**	16 reports a month, 24-hour SLA. Name the person	5 min
☐	**Record today's outbound reply rate**	The ABM ad set is judged against this baseline and nothing else	10 min
☐	**Decide the currency on the site**	USD on site, EUR in docs, AED in strategy. Pick AED	1 hour

Test the pixel with a real form submission, not just the debugger. A pixel that fires in preview but not in production is the most common silent failure here.

The structure

One campaign. Three ad sets. Do not add a fourth.

```
CAMPAIGN  ·  META_Leads_Clinics_Dubai_2026Q4
|   Objective: Leads  ·  Budget: ad-set level (not CBO — see note)
|
├── AD SET 1  ·  Cold prospecting          590 EGP/day  → 475 from day 15
|   └── Ad: 62 Clinics
|       (+ Tuesday Test, added once Day 0 is done)
|
├── AD SET 2  ·  Retargeting               115 EGP/day  — starts day 15
|   └── Ad: Clinic Audit carousel, 6 frames
|
└── AD SET 3  ·  ABM warm-up                65 EGP/day  — from day 1
    └── Ad: 62 Clinics
```

Why ad-set budgets rather than campaign budget optimisation. CBO is the right choice at scale, because it moves money to whatever is working. At 655 EGP a day it would starve two of your three ad sets to feed one — and the ABM and retargeting sets have jobs that are not measured in leads. Hold the budgets manually until you are past 1,500 EGP a day.

Ad set 1 — Cold prospecting

The core. Everything else supports it.

SETTING	VALUE
Daily budget	**590 EGP** days 1–14, then **475 EGP**
Conversion event	**Landing page views** for days 1–21, then Lead
Location	**Dubai** only — not all UAE
Age	28–60
Gender	All
Detailed targeting	**Empty.** No interests, no behaviours
Advantage+ audience	On
Placements	Advantage+ (automatic)
Attribution	7-day click, 1-day view

Why Dubai only. 655 EGP a day across seven emirates means never reaching anyone often enough to be remembered. Concentration is the only advantage a small budget has.

Why landing page views for three weeks. Meta wants roughly 50 conversions per ad set per week to optimise. You will produce about four leads a week. Three weeks on a cheaper, more frequent event gives the pixel something real to learn from before you ask it to find buyers. Switching to the Lead event on day one with this volume is the single most common way a small budget returns nothing.

The ad — 62 Clinics

File: `01-META/ad-02-62-clinics.png`

This runs on day 1 because every number in it is already measured. No tokens to fill.

Primary text

```
We checked 62 UAE clinics that advertise on Instagram. Here is what we found.

35 have a "Book Now" button that opens a form — often with a free-text date field. Somebody on the team retypes every request by hand.

18 have no booking mechanism at all. The button is a phone number.

43 have a WhatsApp button. None of those conversations are recorded, assigned or followed up.

Only 8 have a real calendar. None of those sit inside anything that sends a reminder or chases a no-show.

If your ads are running this week, one of those five lines is about your clinic. We will tell you which one, free, in 24 hours.

Kyntlo — booking, reminders and recall in one place.
```

Headline — `35 of 62 clinics. Same broken button.` **Description** — `Free booking audit` **CTA** — Learn more **Destination** — `/leak-test`

The second ad — added when Day 0 is done

File: `01-META/ad-01-the-tuesday-test.png`

Add it to **this same ad set** — not a new one — so the two compete fairly. It needs `N_TIMED` and `N_NEVER_REPLIED` from the Day 0 timing run, which is one afternoon of work. Until then you are warming the pixel, not running the test.

The real experiment starts the day this ad goes live: personal register against evidential. That answer is worth more than the leads.

Ad set 2 — Retargeting · starts day 15

SETTING	VALUE
Daily budget	**115 EGP**
Audience	Website visitors, 30 days, **excluding** anyone who converted
Conversion event	Lead
Frequency cap	6 per 30 days
Placements	Advantage+

Why day 15 and not day 1. It needs roughly 1,000 people in the pixel pool to work at all. At this spend that takes about two weeks. Turning it on early splits a small budget across an audience that does not exist yet.

The ad — Clinic Audit carousel

Files: `01-META/carousel-frame-01.png` through `-06.png`, in order.

Primary text

```
We checked 62 UAE clinics that advertise on Instagram — every one of them paying for leads right now.

35 have a "Book Now" button that opens a form. 18 have no booking mechanism at all. 43 run their real funnel through a WhatsApp button that records nothing.

Only 8 have a working calendar, and none of those sits inside a system that sends a reminder or chases a no-show.

Swipe for the full breakdown, including how to check your own in about two minutes.
```

Its leads will look remarkably cheap — around a third of cold. That is the warm audience, not brilliance. Judge it against other retargeting only.

Ad set 3 — ABM warm-up · from day 1

The cheapest line here and the only one that makes something you already own work better.

SETTING	VALUE
Daily budget	**65 EGP**
Audience	Custom audience from your 47 interior + 62 clinic records
Objective	**Reach**, not leads
Frequency	2 per week
Ad	62 Clinics

Its job is not a click. It is to make sure that when your cold email arrives, the name is already familiar.

Judge it by outbound reply rate against the baseline you recorded in pre-flight. Never by its own cost per lead — it does not have a meaningful one, and looking at it that way will make you switch off the best-value line in the account.

Google Business — free, do it anyway

Two posts a week, every week, from `06-GOOGLE-BUSINESS`.

Someone reading your profile has already searched your name — usually after seeing an ad or getting a cold email — which makes it the highest-intent traffic in the campaign. Profile posts decay after about seven days, so a stale profile reads as a dead business. That is the only way this one fails.

The month, day by day

DAYS	COLD	RETARGET	ABM	DAILY TOTAL	WHAT YOU ARE DOING
1–14	590	—	65	**655 EGP**	Warming the pixel. Change nothing.
15–30	475	115	65	**655 EGP**	Retargeting on. Switch to Lead event on day 21.

Monthly: 19,650 EGP spent, ~350 held back.

The four moments that need a decision

DAY	CHECK	DO THIS
7	Is the pixel firing? Are landing page views arriving at a sane cost?	Fix tracking if not. **Do not touch the ads.**
15	Pixel pool past 1,000?	Switch on ad set 2.
21	Have you had at least 15 landing page views a day for a week?	Switch ad set 1 to the **Lead** event. If not, hold another week.
30	Cost per qualified lead against the $85 target. Qualified rate against 40%.	See the decision table below.

Between those four dates, change nothing. This is the hardest instruction in the document and the one that costs most when broken. At this budget you do not have enough data to improve anything before day 30 — you only have enough to damage it.

What to expect

	MONTH 1	MONTH 2	MONTH 3
Leads	10–14	16–18	18–22
Qualified	5–6	7–8	8–10
Calls held	2	2–3	3–4
Signed	**0–1**	**1**	**1–2**

Month 1 is deliberately the weakest: the learning phase eats most of it, and the Tuesday Test probably is not live yet. Month 3 is better on the same spend because the pixel has history, the retargeting pool is full, and you know which register wins.

One customer a month at AED 1,500–4,000 against AED 1,530 of spend pays the month back in about a month. The volume is slow. The economics are better than the large plan's.

Use the advantage a small budget gives you

Sixteen leads a month is a number one person can work entirely by hand. Call every one. Chase every one. That is why the call rate above is higher than the large-budget model assumed — at 340 leads a month it is impossible and the funnel leaks.

Day 30 — the decision

WHAT YOU SEE	WHAT IT MEANS	DO
Cost per qualified lead **≤ $85**, qualified rate **≥ 40%**	Working	Hold the budget one more month, then raise it 20% from revenue
CPQL **$85–130**	Promising, not proven	Hold. Add the Tuesday Test if it is not live. Give it month 2
CPQL **> $130**, qualified rate **≥ 40%**	Right people, wrong price	The landing page is the problem, not the ad. Mirror the winning headline onto it
Qualified rate **< 40%**	Wrong people	Swap the angle, keep the format
Zero leads at 3× target spend	The concept is dead	Kill it. Do not iterate a dead angle — try the Tuesday Test instead

Never raise the budget from savings. Raise it from the customers the budget produced. When you reach 35,000 EGP a month, `00-BUDGET-20K-EGP` has the ladder for which platform to add next.

Six things not to do

1. **Do not split across platforms.** TikTok's minimum alone is 146% of this month's budget.
2. **Do not target all seven emirates.** Dubai only.
3. **Do not add interest targeting.** It will make the audience worse, not better.
4. **Do not edit a running ad.** Editing resets the learning phase. Duplicate and launch alongside instead — pausing is free, editing is not.
5. **Do not judge before day 30.** The kill rules want 3× target cost per lead of spend. At this budget that is most of a month.
6. **Do not let the 24-hour report SLA slip.** This campaign sells speed of response to people you have just taught to measure speed of response. A three-day report disproves the thesis to exactly the people you most wanted to impress.
